

1. ABSTRACT

The purpose of this document is to give a thorough explanation of the Web Publishing System. It will describe the system's characteristics, its user interfaces, what it will be able to do, the limitations that must be adhered to, and how the system will respond to outside stimuli. The modernization of the world has led to the need for an online website. For any kind of business having an internet presence is essential. Consumers may now use all the services a business offers while relaxing in their homes with just a few clicks. This has broadened the market for businesses and made life simpler for both buyers and sellers. On this website, we plan on taking the automobile industry online and people can simply browse through our website and check for product availability and contact the owner regarding the products without compromising on the quality of the product. The aim of this paper is to build and develop a reliable website based on e-commerce theories, developing effective well designed web pages. This system also abides by the covid-19 regulations and restrictions ensuring no overcrowding and promoting digital India. All in all, unlike offline work that is carried out physically with the effort of a person to go & get products, e-commerce has made it easier for humans to reduce physical work and save time.

2. INTRODUCTION

This website is an e-commerce web application to shop the automobile products Engine oils and Tyres. This system will be designed to maximize the sales of the product offered on this website by providing tools to assist in easily navigating the website for checking the availability, contacting the store online, and checking our products online. The sole purpose of designing this website was to reinforce a friendly environment for our customers.

It provides necessities, and a very user-friendly and straightforward interface makes it much easier to shop adding benefits to our customers.

The main page is the primary page the end user will stumble upon, the page mainly consists of a short note about the website and products available.

On the product page, the user will have a wide range of choices from two different types of automobile essentials mainly Engine oils and Tyres.

2.1 Problem Definition:

Currently, the business is offline and the company wants the consumers to get genuine products directly from the company. The company also wants its product to be available very easily for the user to reach out to us directly. The proposed system is limited to only checking the availability.

Solution:

A separate database will be formed for customer interaction as the clients only want their customers to purchase their products in offline mode. Through a customer interaction space, they interact about our services and further their shopping experience to come in an offline mode and shop for their needs.

2.2 Scope of the Project:

Our website is an e-commerce platform that allows users to purchase oils, tyres, and spare parts online. The website will provide a simple and user-friendly interface for customers to browse products, and place orders. The website will also provide an easy-to-use back-end interface for administrators to manage the website and perform various administrative tasks.

2.3 Objectives of the project:

The main objectives of the project are as follows:

1. To develop a user and client-friendly website which functions smoothly for both.
2. As our client already has a good reach throughout the district we have planned to design our website in such a way that products and order details can be exchanged between the customers and clients without actually visiting the store.
3. We have planned for a self-pick-up instead of delivery due to the product availability and variations.

3. Requirement Specification:

Below are the hardware and software specifications specified in our project.

3.1 Hardware Requirements:

Hardware	Processor	Intel dual core with 2Gz or above
	RAM	2GB
	System	Windows 7-11
	Total Memory	8.12 MB
	Cache Size	3 MB
	Hard Disk Space	256 GB and above

3.2 Software Requirements:

Software	PKI	
	Repository	
	Database	Xamp
	Programming Tool	Visual Studio Code, Sublime
	Operating System	Windows 7-11

3.3 Functional Requirements:

The following are the functional requirements for the automobiles and spare parts website:

➤ User registration and login:

The website should allow users to create an account and should be able to access the login and logout.

➤ Shopping cart:

The website should allow users to add products to a shopping cart and review their cart before proceeding to checkout.

➤ Checkout:

The website should allow users to place orders.

The website should allow administrators to manage orders, including reviewing orders, updating order status, and generating reports.

➤ Product management:

The website should allow administrators to manage products, including adding new products, updating product information, and removing products.

➤ User management:

The website should allow administrators to manage users, including creating new user accounts, updating user information, and deactivating user accounts.

3.4 Non-functional Requirements:

The following are the non-functional requirements for the oils and tyres shop website:

➤ Performance:

The website should be fast and responsive, with low page load times and high availability.

➤ Security:

The website should be secure and protect user data and payment information from unauthorized access.

➤ Scalability:

The website should be designed to handle a large number of users and products and should be easily scalable to accommodate future growth.

➤ Compatibility:

The website should be compatible with a wide range of web browsers and devices, including desktop and mobile devices.

3.5 Technical Requirements:

The following are the technical requirements for the automobiles and spare parts website:

➤ Programming language:

The website should be developed using a modern web programming language, such as HTML, CSS, PHP, XAMP, SQL etc.,

➤ Framework:

The website should be built using a popular web development framework, such as PHP.

➤ Database:

The website should use a relational database management system such as MySQL.

4. Development tools / technology

4.1 FRONTEND

HTML:

Hypertext Mark-up Language (HTML) is the standard mark-up language for documents designed to be displayed in a web browser. It can be assisted by technologies such as Cascading Style Sheets (CSS) and scripting languages such as JavaScript.

HTML elements are the building blocks of HTML pages. With HTML constructs, images and other objects such as interactive forms may be embedded into the rendered page. HTML provides a means to create structured documents by denoting structural semantics for text such as headings, paragraphs, lists, links, quotes, and other items. HTML elements are delineated by tags, written using angle brackets. Tags such as `` and `<input />` directly introduce content to the page. Other tags such as `<p>` surround and provide information about document text and may include other tags as sub-elements. Browsers do not display the HTML tags but use them to interpret the content of the page.

CSS:

Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a mark-up language such as HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.

CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, and enable multiple web pages to share formatting by specifying the relevant CSS in a separate .css file which reduces complexity and repetition in Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language such as HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.

CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, and enable multiple web pages to share formatting by specifying the relevant CSS separately. CSS file also reduces complexity and repetition in the code.

JAVA SCRIPT:

JavaScript often abbreviated as JS, is a programming language that conforms to the ECMAScript specification. JavaScript is high-level, often just-in-time compiled, and multiparadigm. It has curly-bracket syntax, dynamic typing, prototype-based object orientation, and first-class functions.

Alongside HTML and CSS, JavaScript is one of the core technologies of the World Wide Web. JavaScript enables interactive web pages and is an essential part of web applications. The vast majority of websites use it for client-side page behavior, and all major web browsers have a dedicated JavaScript engine to execute it.

JavaScript engines were originally used only in web browsers, but they are now embedded in some servers, usually via Node.js. They are also embedded in a variety of applications created with frameworks such as Electron and Cordova.

4.2BACKEND

XAMPP:

XAMPP is an abbreviation where X stands for Cross-Platform, A stands for Apache, M stands for MySQL, and Ps stand for PHP and Perl, respectively. It is an open-source package of web solutions that includes Apache distribution for many servers and command-line executables along with modules such as Apache server, and PHP.

XAMPP helps a local host or server to test its website and clients via computers and laptops before releasing it to the main server. It is a platform that furnishes a suitable environment to test and verify the working of projects based on Apache, MySQL database, and PHP through the system of the host itself. Among these technologies, Perl is a programming language used for web development, PHP is a backend scripting language and is the most vividly used database developed by MySQL. A detailed description of these components is given below.

5. STUDY OF THE PROPOSED SYSTEM

This is a software project for the company “MAITHREYA AGENCIES”.

The system presented by us can be utilized for easy access by the users. The proposed system provides the feature of displaying the products on the website. The user can view different varieties of products and their details and also have an opportunity to check for availability, calculate the price, have an estimate about the budget, and contact the team easily. The easily navigable website helps guide the customers and be user-friendly.

We have finished the front and backend parts of our project. Using the following languages. We have used HTML, CSS, and JAVASCRIPT for our front-end design. And for the backend, we have used XAMPP.

6. ANALYSIS

6.1 Feasibility:

Feasibility Criteria	Weight (Percentage) 70 %
----------------------	-----------------------------

6.1.1 Operational Feasibility:

Operational Feasibility : A description of to what degree the candidate would benefit the organization and how well the system Would work	40 %
--	------

6.1.2 Technical Feasibility:

Technical Feasibility: An assessment of the maturity, available(or ability to acquire) and desirability of computer technology needed to support this candidate	30%
--	-----

6.1.3 Economic Feasibility:

Economic Feasibility: Cost to Develop:	30%
--	-----

8. System Design:

SOFTWARE DESIGN AND ITS OBJECTIVES

The results of the system design process are recorded in the system design document. It describes a deep architectural level which also includes Subsystems and their services, Hardware mapping, Data management, Access control, Global software control Structure, and also boundary conditions. A virtual machine is defined by software design. Element all requirements in the given project. And it should also provide a. Functional guide. Further implementation. to an Executable solution.

Smaller components called subsystems combine to form a system relation. Among these subsystems is defined in the design and also they are checked whether an intended behavior is not noted in each of the subsystems.

Each system is analyzed separately and noted if they can work. A single person can handle it with ease if they're smaller in comparison and if their complexity is low.

PURPOSE

The purpose of this document is to fully understand the software requirements using these system design document software. This document can also be used as a guide to users on how to use this software effectively and efficiently.

The document describes the requirement of the system that is meant for the use of the developer. It will be the basis for the validation of the final system. Any change in the requirement in the future will have to go through a formal process. This document describes the requirement of the system that is meant for the use of the developer by the client.

Information architectural

Our products are mainly categorized on the basis of the information from the home page containing the modules such As:

Engine oils and Tyres

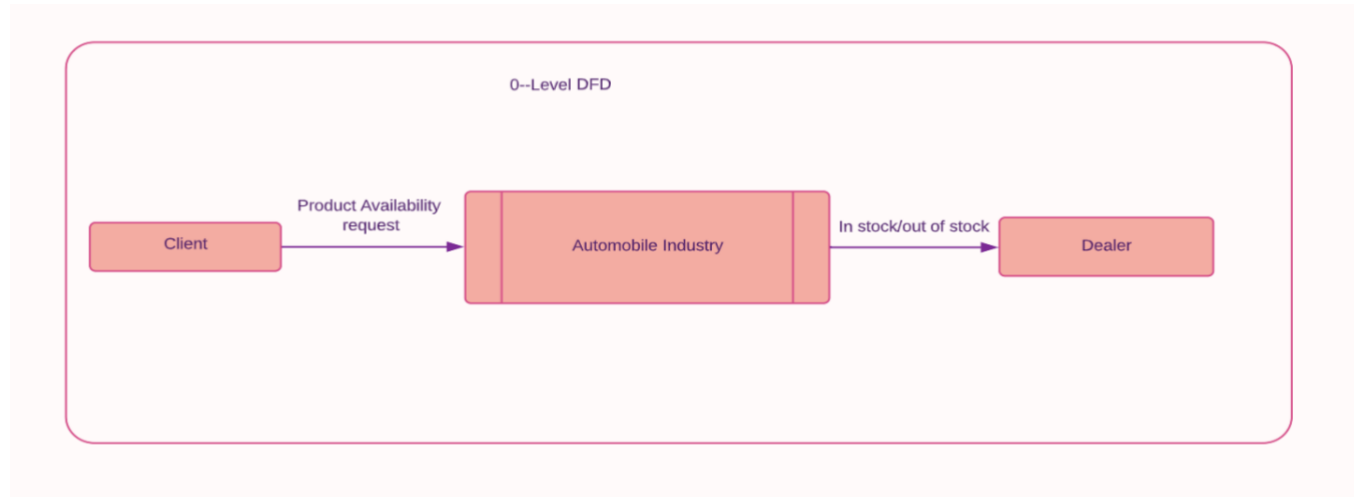

About the design.

The module comprises the Web page containing the complete detail of the website for Maithreya Agencies. This contains the idea of the website. Of why it was developed. And the uses of each module of the website.

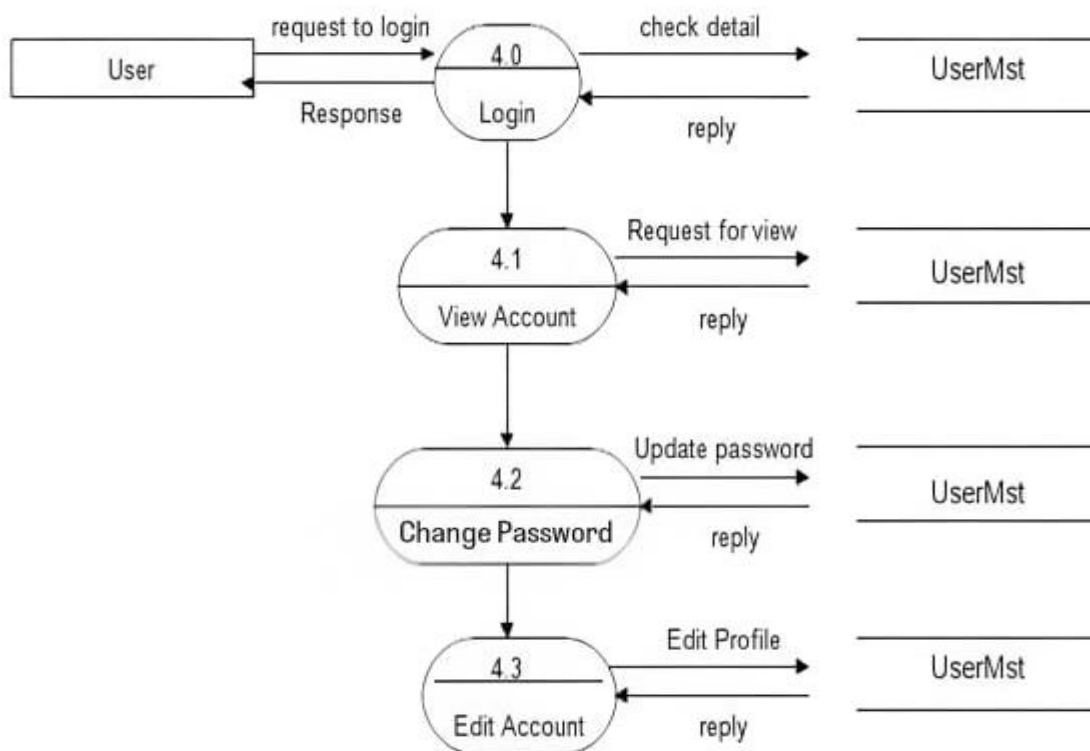

8.1 DATA FLOW DIAGRAM:

The flow of data of a system or a process is represented by DFD. It also gives insight into the inputs and outputs of each entity and the process itself.

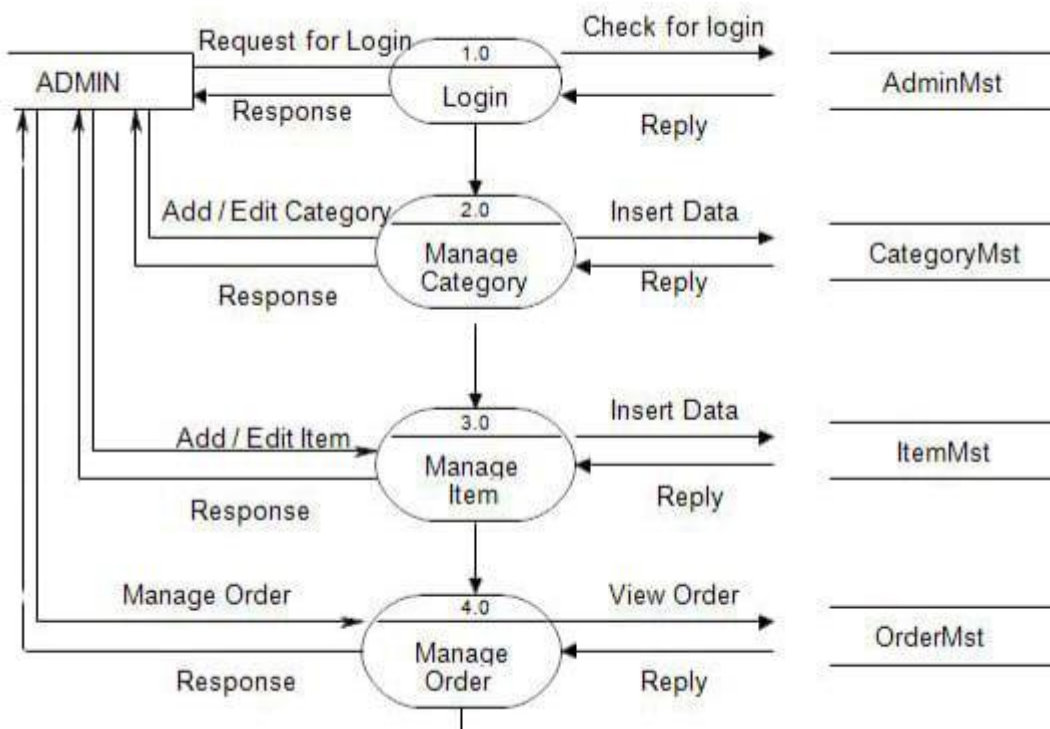

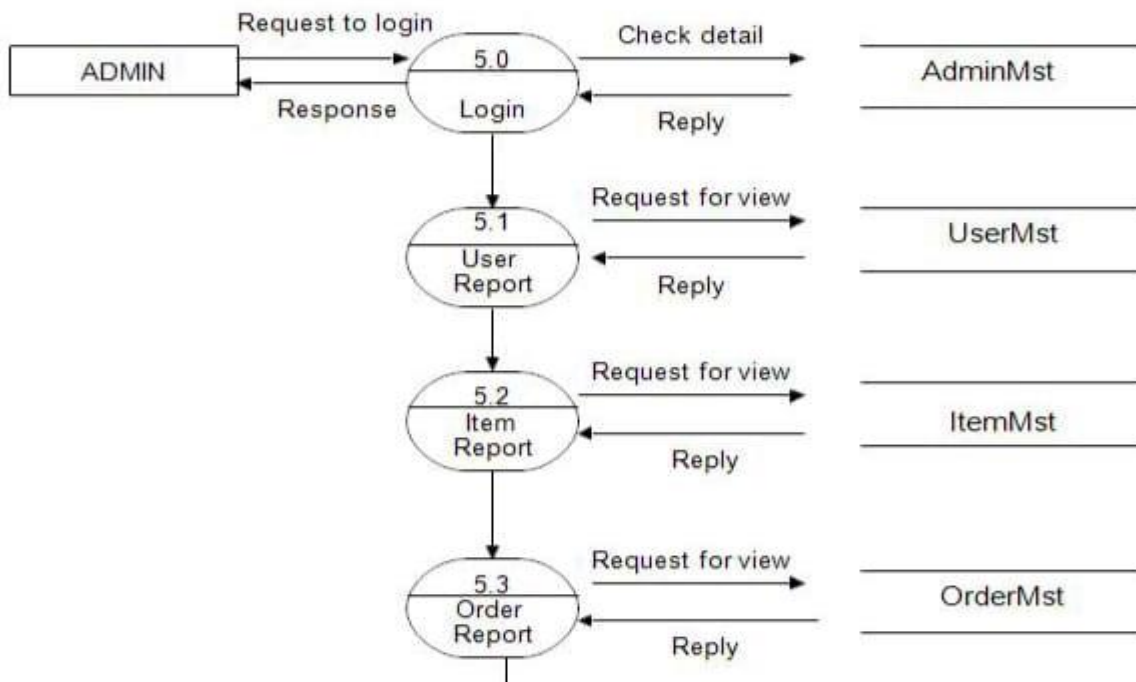

0-Level DFD:

DATA FLOW ACCORDING TO THE USER:

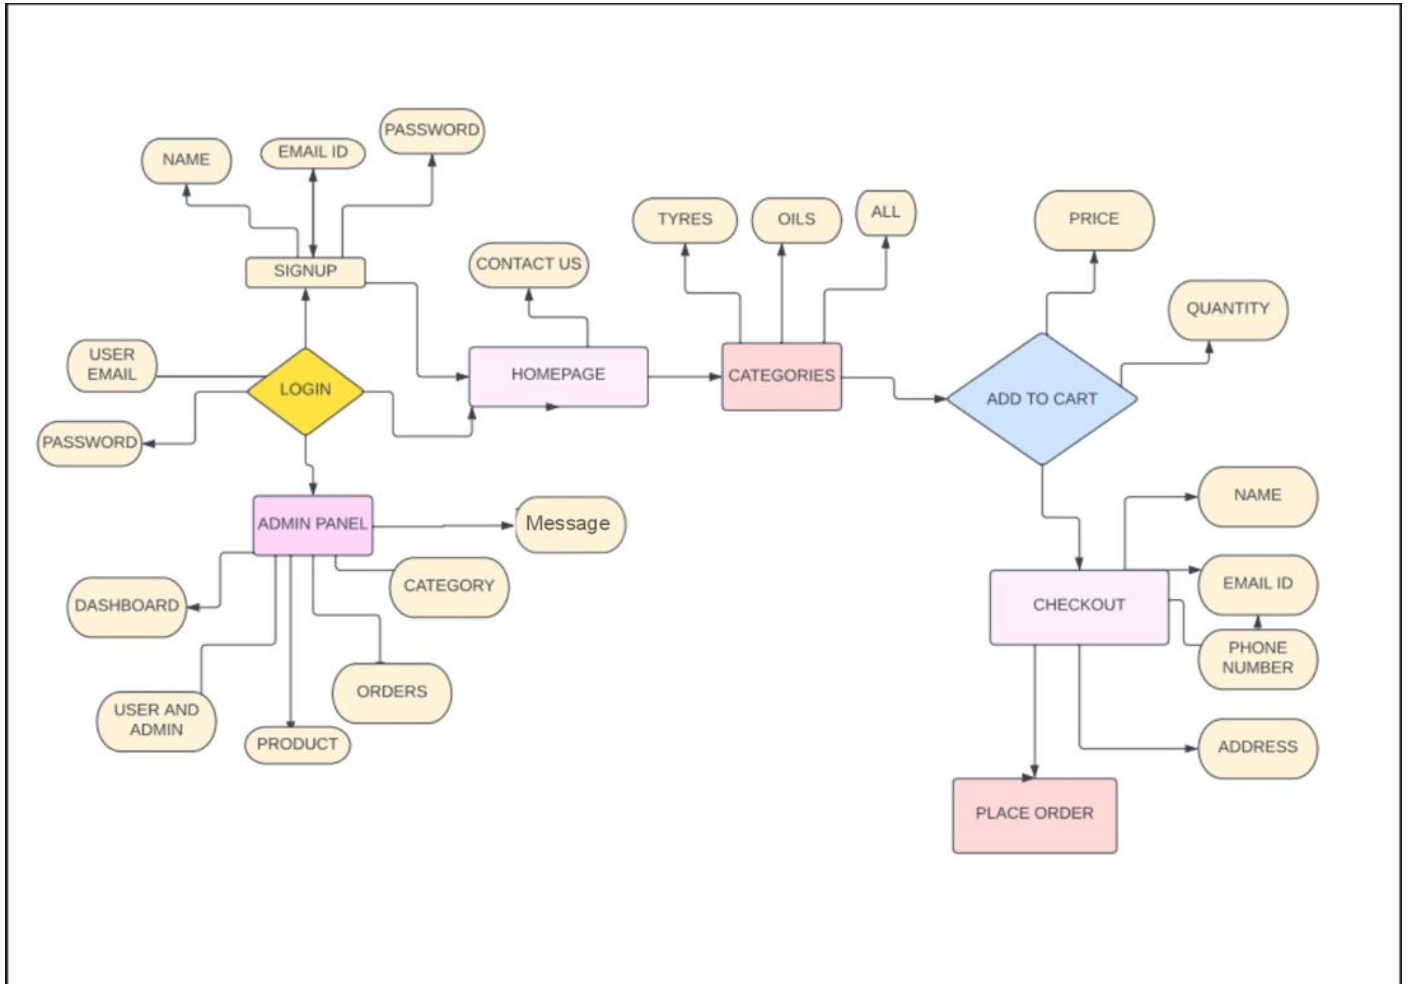

DATA FLOW ACCORDING TO THE ADMIN:

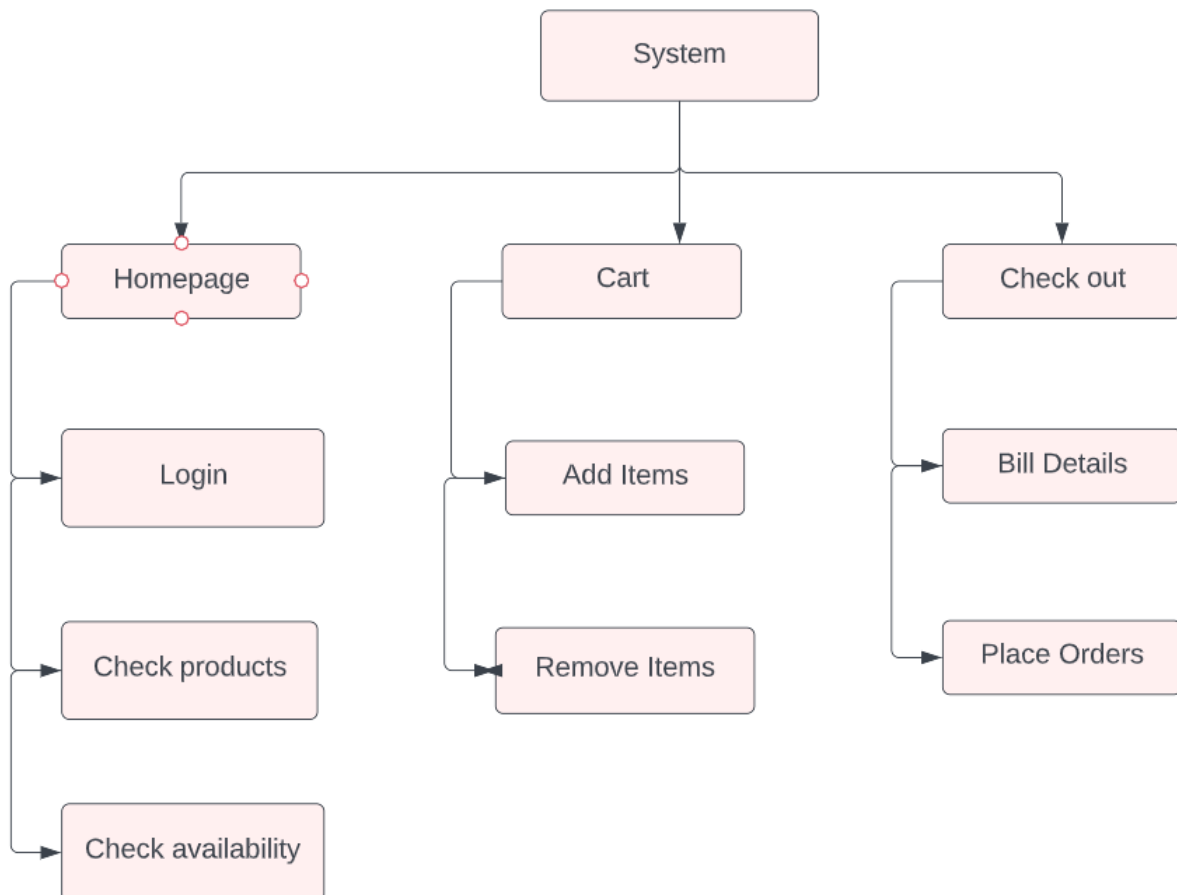

8.2 ENTITY Relationship (ER) DIAGRAM

An entity-relationship ER diagram is a specialized graphic that illustrates the interrelationship between entities in a database. The entity-relationship model is the high-level conceptual data model. ER, the model helps in depicting the entire problem requirements in the System for the ER diagram.

8.3 Functional Decomposition:

8.4 Data Dictionary:

Cart page:

Field Name	Data Type	Field Length	Constraints	Description
id	Int(11)	10	Primary key	Client id generated

Cart page:

The screenshot shows the phpMyAdmin interface for the 'maithreyaagencies' database. The 'cart' table is selected, and its structure is displayed. The table has 7 columns: id, product_name, product_price, product_image, qty, total_price, and product_code. The data is as follows:

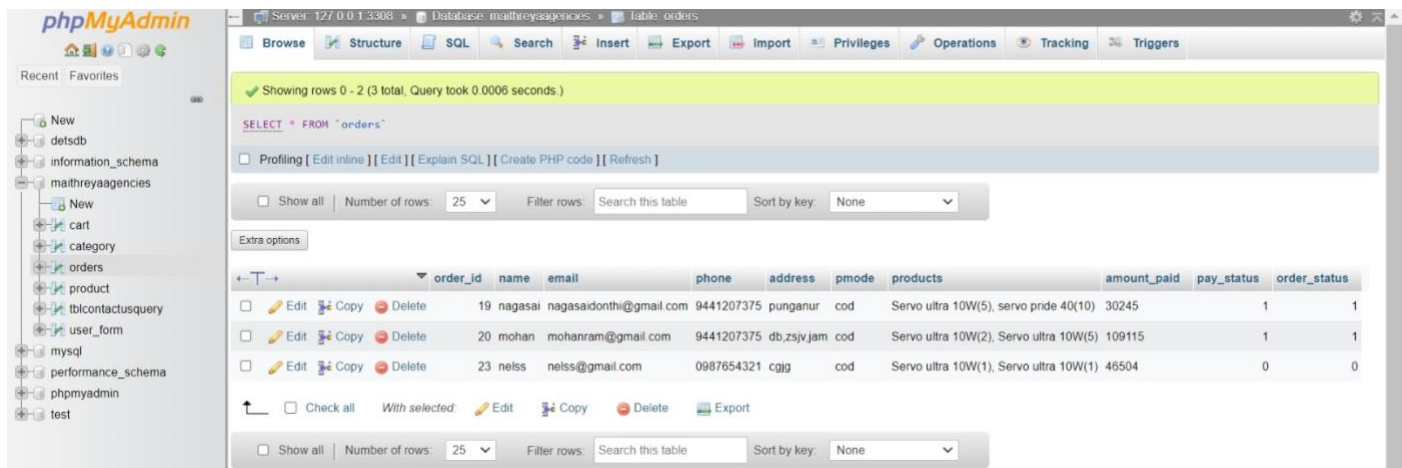

id	product_name	product_price	product_image	qty	total_price	product_code
93	Servo ultra 10W	5369	/uploads/3.jpeg	1	5369	5
94	servo pride 40	340	/uploads/5.jpeg	1	340	10
95	Servo pride 40	1622	/uploads/7.jpeg	1	1622	11

Category page:

The screenshot shows the phpMyAdmin interface for the 'maithreyaagencies' database. The 'category' table is selected, and its structure is displayed. The table has 2 columns: category_id and category_name. The data is as follows:

category_id	category_name
1	Tyres
2	Engine oils
4	All

9. DATABASE DESIGN:

Database design can be generally defined as a collection of tasks or processes that enhance the designing, development, implementation, and maintenance of an enterprise data management system. Designing a proper database reduces the maintenance cost thereby improving data consistency and the cost-effective measures are greatly influenced in terms of disk storage space. Therefore, there has to be a brilliant concept for designing a database. The designer should follow the constraints and decide how the elements correlate and what kind of data must be stored.

9.1 DATABASE STRUCTURE:

9.2 Normalization:

Normalization is the process of organizing the data in the database. It is used to minimize the redundancy from a relation or set of relations

Here we use the first normal form. A relation is in first normal form if it does not contain any composite or multi-valued attribute. A relation is in first normal form if every attribute in that relation is singled valued attribute.

Homepage Javascript:

```

const selectImage = document.querySelector('.select-image');
const inputFile = document.querySelector('#file');
const imgArea = document.querySelector('.img-area');

selectImage.addEventListener('click', function () {
  inputFile.click();
})

inputFile.addEventListener('change', function () {
  const image = this.files[0]
  if(image.size < 2000000) {
    const reader = new FileReader();
    reader.onload = ()=> {
      const allImg = imgArea.querySelectorAll('img');
      allImg.forEach(item=> item.remove());
      const imgUrl = reader.result;

```

```
const img = document.createElement('img');
img.src = imgUrl;
imgArea.appendChild(img);
imgArea.classList.add('active');
imgArea.dataset.img = image.name;
}
reader.readAsDataURL(image);
} else {
    alert("Image size more than 2MB");
}
```

11. Implementation:

System implementation is the main stage of project when the hypothetical design is brought into harmony into useful method.

The main stages of implementation are

- Planning
- Training
- System testing and
- Change over planning.

Planning is the first task in the bureaucracy exercise. At the time of exercise of some plan, society from various areas and system reasoning are complicated. They are rooted to proficient question of ruling differing actions of population outside their own data conversion departments. The line managers are regulated through an exercise relating panel. The chamber considers side as, questions and discontents of consumer area, it must again consider:

- The association of whole surroundings.
- Self collection and distribution for exercise tasks.
- Consultation accompanying unions and money usable.
- Standby conveniences and channels of communication.

Our Project “MAITHREYA AGENCIES” will contain the details of the users, admin and it will help the user to place orders for purchasing tyres and oils and manage the booking of the users.

And only the admin will have access to the admin panel where the admin can increase the stock, add items, add categories, check and confirm the order.

12 Planning Scheduling:

Week1: Team gathering and project briefing

Week2: Finding client, synopsis, and NOC

Week3: Requirement analysis and feasibility

Week4: UI design development

Week5: Analyzing database with available resources

Week6: UI design code for the backend

Week7: Validation and adding data to the database

Week8: Testing and modifying

Week9: Demo of the project

Week10: Documentation and guide verification

13. Testing:

E-Commerce website testing involves reviewing the website or web application for any issues before it goes live and is open to the public. A web application requires testing on various features like security, functionality, database, etc.

13.1 Testing Strategies:

A test strategy is an outline that describes the testing approach of the software development cycle. The purpose of a test strategy is to provide a rational deduction from organizational, high-level objectives to actual test activities to meet those objectives from a quality assurance perspective.

There are different types of testing strategies:

- Unit testing
- Integration testing
- Security testing
- Connectivity testing
- User Acceptance testing
- Production verification testing

13.1.1 Unit testing:

A unit test is a way of testing a unit - the smallest piece of code that can be logically isolated in a system. In most programming languages, that is a function, a subroutine, a method or property.

13.1.2 Integration testing:

Integration testing -- also known as integration and testing (I&T) -- is a type of software testing in which the different units, modules or components of a software application are tested as a combined entity.

13.1.3 Security testing:

Software security testing is a software testing process that ensures the software is free of any potential vulnerabilities or weaknesses, risks, or threats so that the software might not harm the user system and data.

13.1.4 Connectivity testing:

Connectivity Tests is a diagnostics tool that lets you check connectivity between network endpoints. It analyzes your configuration and, in some cases, performs live data plane analysis between the endpoints.

13.1.5 User Acceptance testing:

User acceptance testing (UAT), also called application testing or end-user testing, is a phase of software development in which the software is tested in the real world by its intended audience.

13.1.6 Production Verification:

Verification testing is used to confirm that a product meets specifications or requirements as defined in Phase Zero of the product development process.

Test level	External party	Project team	Business
Unit testing	-----	Primary	-----
Integration testing	-----	Primary	-----
Security testing	Primary	Secondary	Primary
Connectivity testing	Primary	Secondary	Primary
User Acceptance testing	Primary	Secondary	Secondary
Production verification testing	-----	Secondary	Primary

Test cases:

Sl. no	Test case id	Test Description	Steps to Execute	Test Data	Expected Result	Actual Result	Status
1.	Test case 01	Correct email id and password	Enter email id and password in the login form and clicks enter.	Correct email id and password	Successful login	Successful login	pass
2.	Test case 02	Correct email id and wrong password	Enter email id and password in the login form and clicks enter.	Correct email id and wrong password	Login failed. Pops up incorrect email or password	Login Failed	pass
3.	Test case 03	Adding products to cart	Go to shop page and add products to cart	products is being added to the cart	products successfully added	products successfully added	pass
4.	Test case 04	Checkout	The user finalizes the products being added and moves to the checkout page.	Fill in the proper details.	Details collected	Details collected	pass
5.	Test case 05	Place order	The user completes giving the details , so the user is hereby able to place the order.	place order	Order placed successfully	Order placed successfully	pass

6.	Test case 06	Admin add products	Admin adds products to the product page from the admin panel	Products are being added	products successfully added	products successfully added	pass
7.	Test case 07	Admin Delete products	Admin deletes products in the product page from the admin panel	Products are being removed	Products successfully removed	Products successfully removed	pass
9.	Test case 09	Add category	Admin adds a category of product in the category page from the admin panel.	Category is being added	Successfully added	Successfully added	pass

8.	Test case 08	Increase the quantity of the product	Admin increases the quantity the product from the admin panel	Quantity is increased	Successfully increased	Successfully increased	pass
----	--------------	--------------------------------------	---	-----------------------	------------------------	------------------------	------

9.	Test case 09	Add category	Admin adds a category of product in the category page from the admin panel.	Category is being added	Successfully added	Successfully added	pass
10.	Test case 10	Remove category	Admin removes a category in the category page from admin panel	Category is being removed	Successfully removed	Successfully removed	pass
11.	Test case 11	Message	User sends an message to the admin from the contact page	Message is being to the admin	Successfully received	Successfully received	pass
12.	Test case 12	Add user	When a new user logs in the details is being record in the admin panel	User is being added	User added successfully	User added successfully	pass
13.	Test case 13	Order confirmation	The admin accepts the order and confirms it in the admin panel.	Order is being accepted	Order confirmed	Order confirmed	pass

14.	Test case 14	Payment confirmation	Admin confirms the payment status in the admin panel.	Payment is being confirmed	Payment confirmed	Payment confirmed	pass
15.	Test case 15	Clear cart	When the user selects the option clear cart to remove all the products from the cart.	Products are being removed	Cart cleared	Cart cleared	pass
16.	Test case 16	Remove products from cart	When the user wants to remove a particular product from the cart.	Product is being removed.	Product removed	Product removed	pass

13.3 Roles and responsibility:

13.4 Threads for testing:

14. Future Enhancement and Conclusion:

14.1 Future Enhancement:

The project has a very outlook for the guest from now on. The project may be executed on the intranet from now on. The project may be restored in the forthcoming future as and when the necessity for the alike stands, as it is very liable in conditions of expansions. The customer is immediately smart to accomplish and therefore runs the whole introduce a much better, correct, and mistake-free category.

In the future, we are planning to upgrade the current project and categorize the products according to vehicle specifications.

We are planning to add a search bar and upgrade the database.

14.2 Conclusion:

The project 'MAITHREYA AGENCIES' was successfully developed and tested and also implemented in all the various cases and platforms of the computer browsers. The website that is been developed will provide a user-friendly and working and will also be efficient in achieving the needs and requirements of the client. All the constraints have been taken care of by the system as specified the concerned aspects are fulfilled in the system and found really beneficial. The website developed is completely functional and ready to be implemented

The main idea was to develop an easy to use frontend using languages

HTML, CSS, BOOTSTRAP, JAVASCRIPT

The back end uses languages

PHP, MYSQL
